INDIA PERSONAL LOAN LANDSCAPE: A 21-YEAR ANALYSIS (2004–2025)

Regional Growth Hubs, ETL Pipeline, and Predictive Forecasting

AGENDA

1. Overview
2. Bridging the Gap from Raw Data to Analysis
3. The National Credit Explosion
4. Regional Hubs & Market Concentration
5. Future Outlook & Strategic Summary

OVERVIEW

The Dataset

This project utilizes 21 years of historical data (2004–2025) sourced from the **Reserve Bank of India (RBI)**. The dataset provides a comprehensive look at scheduled commercial bank credit, specifically focusing on the Personal Loan segment across all Indian States and Union Territories.

The Objective

The goal was to transform fragmented, high-volume government reports into a unified interactive dashboard. By reconciling historical administrative changes and unpivoting complex raw data, this analysis identifies regional credit hubs and the long-term growth trajectories of India's retail lending market.

BRIDGING THE GAP FROM RAW DATA TO ANALYSIS

1. The ETL Challenge (Power Query)

Unpivoting: Transformed the RBI's "Wide" reporting format (where years were columns) into a "Long" time-series format. This was essential for dynamic filtering and trend analysis.

Scaling: Normalized disbursement values to **₹ Crores** to ensure consistent financial labeling across the 21-year timeline.

2. Data Integrity & Mapping

Administrative Reconciliation: Manually resolved geographical shifts, specifically merging **Dadra & Nagar Haveli** and **Daman & Diu** to align with the current 36 States/UTs of India.

Cleaning: Handled missing historical entries and standardized state naming conventions to ensure 100% accuracy in the geographic map visuals.

THE NATIONAL CREDIT EXPLOSION

1. **The "Hockey Stick" Curve:** After a decade of steady growth, the market experienced an aggressive surge starting in 2021. This "Hockey Stick" curve reflects the massive adoption of digital lending and fintech platforms across India.
2. **Market Scale:** The total analyzed disbursement reached **₹37.89M Cr**, with the post-2021 volume representing a significant portion of the 21-year historical total.

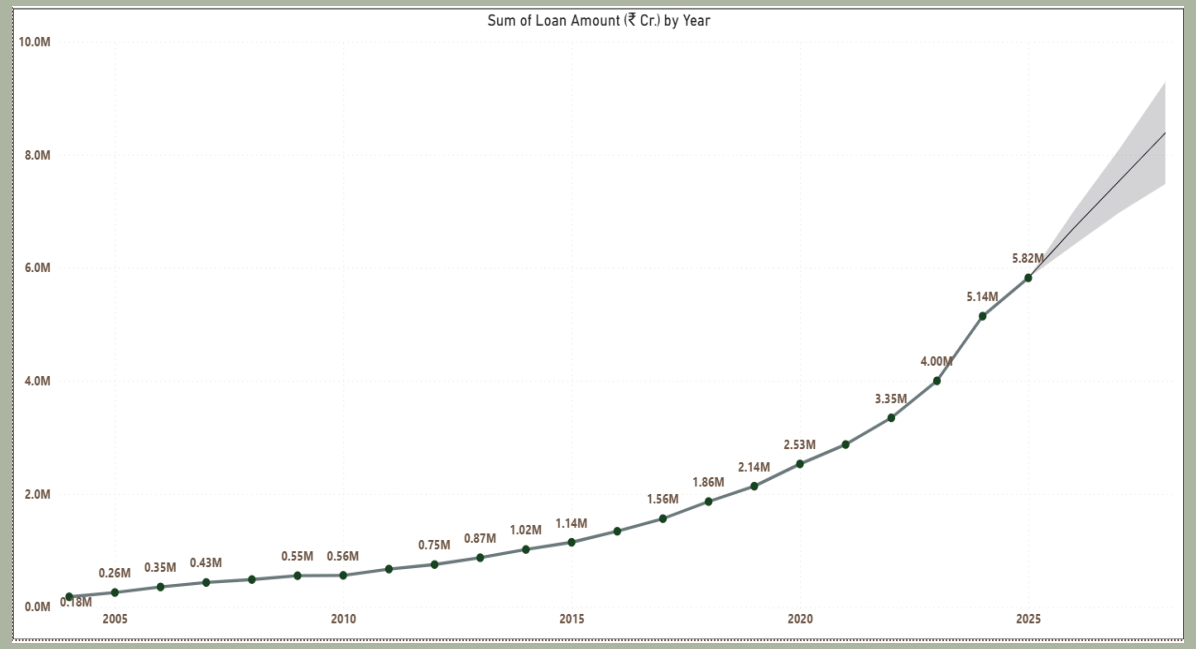

Figure 1: 21-Year National Loan Growth (2004–2025) with Predictive Forecasting (Shaded Area).

REGIONAL HUBS & MARKET CONCENTRATION

1. **The Big Three: Maharashtra (18.76%), Karnataka (9.64%) and Tamil Nadu (9.43%)** consistently emerge as the primary engines of India's personal loan market, collectively commanding a massive portion of the national volume
2. **Geographic Concentration:** Analysis shows that high credit velocity is concentrated in industrialized states with established financial hubs, though Tier 2 regions are showing emerging growth.
3. **Dynamic Market Share:** Utilizing DAX, I calculated real-time market share percentages for all **36 States/UTs**, ensuring that every region—from the largest states to the smallest Union Territories—is accurately represented in the total **₹37.89M Cr** volume.

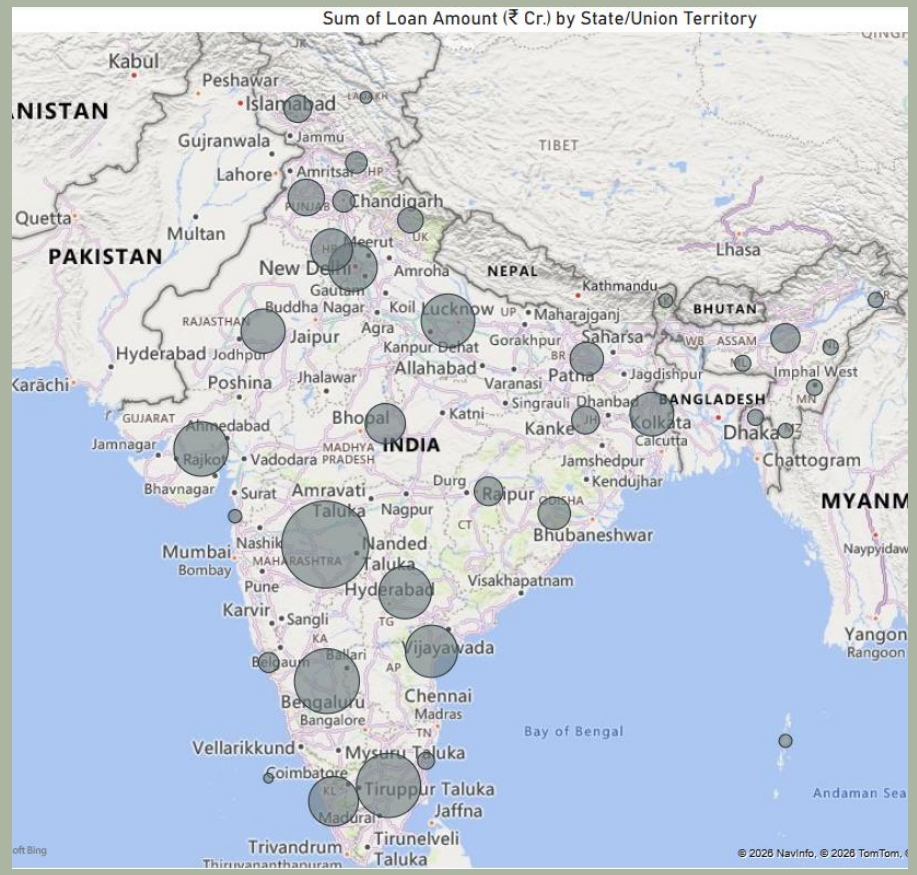

Figure 2: Geographic Credit Distribution & Top-Tier Market Share.

FUTURE OUTLOOK & STRATEGIC SUMMARY

1. **Predictive Insights:** Utilizing **Exponential Smoothing** models, the analysis projects a continued upward trend in domestic credit demand. This suggests that the post-2021 momentum is not a temporary spike but a structural shift in India's borrowing behavior.
2. **National Impact:** The transition from traditional banking to a high-velocity, digital-first credit ecosystem is visible nationwide. By reconciling **21 years** of fragmented data, this project provides a unified, "bank-grade" view of the factors driving India's **₹37.89M Cr** market.
3. **Project Conclusion:** This analysis serves as a strategic roadmap for identifying emerging growth "hotspots" and understanding regional credit concentration across all **36 States/UTs**.
